Operating Information

Windsor Expert Carpet Extractor

FILLING THE SOLUTION TANK:

1. Remove clear dome from recovery tank.
2. Lift upper recovery tank from machine and set aside.
3. Use a clean bucket or hose to fill solution tank with hot water. The solution tank holds 4 gallons (15.2 liters) of cleaning solution.

Do not use the recovery tank to fill the solution tank. Sediment in the recovery tank can damage the solution pump and clog the spray jets, rendering the machine inoperable.

4. Add a non-foaming concentrate for use in hot water extractors at the proportions noted on the container.

To avoid possible distortion of the polyethylene solution/ recovery tanks, DO NOT USE WATER WITH A TEMPERATURE THAT EXCEEDS 140° F.

5. Place recovery tank back on machine.
6. Place dome on recovery tank. Make sure dome is seated correctly to ensure proper vacuum seal.

OPERATING THE MACHINE:

1. Vacuum the carpet and make sure it is cleared of surface debris before cleaning.
2. Plug power cord into a grounded wall outlet.
3. Turn on the pump, brush and vacuum switches, listening for each motor to turn on.

NOTE: The vacuum and the brush are protected by circuit breakers located on the back panel, below their respective switch.

NOTE: If either of these motors does not respond to being switched on, reset the circuit breakers by pressing them in, and attempt to switch the machine on again.

NOTE: If solution does not dispense in an even pattern across the width of the machine, the spray jet may be clogged. Tilt the machine back and remove the spray tip by pushing in and turning it one quarter turn. Wash it thoroughly, and blow dry.

NOTE: Do not use pins, wire etc. to clean spray jet nozzle as this will deform the jet and destroy the spray pattern.

4. Begin with the machine at the edge of the carpet. Actuate the solution lever while pulling the machine backwards. Release solution lever at least 12 inches before the end of each cleaning pass. This will ensure all dispensed cleaning solution is extracted from the carpet.

While operating machine, check for excessive foam buildup in the recovery tank. If excessive foam is present, add a defoamer solution to recovery tank, or empty tank.

5. Empty recovery tank when approximately 3/4 full. If the recovery tank is overfilled, the water will drain back onto the carpet when the vacuum is switched off.
6. Ventilate area after carpet has been cleaned. Keep children and pets away and do not walk on carpet until it is dry. A surface dryer can be used to reduce drying time.
OPERATING MACHINE WITH ACCESSORY TOOLS

1. Lift flap on the front of the vac shoe and insert hose cuff into the vac shoe, ensuring that there is a tight fit.
2. Attach the solution hose from accessory tool to the brass solution fitting on the front of machine.
3. Switch on the pump and the vacuum. The application of cleaning solution is now controlled by the lever on the accessory tool.

Do not switch on brush when operating the machine with accessory tools. Carpet damage may occur.

NOTE: The solution pump is not intended to run dry. When using the extractor for vacuum pick-up only, insure that the pump switch is turned off.
